

# CV

## Who Am I

My name is Christoffer Enne, born in 1989, I am a highly creative person with a fascination for technical art and programming.

I love gaming and programming, so my preferred hobby is game development, which I've been lucky enough to be able to do professionally. I've always been a very creative person drawing and creating things on a regular basis, always coming up with new ideas. I started venturing into programming through GameMaker when I was 16 years old. I find game development to be interesting because it's a combination of many different areas in programming (performance, networking, realtime-like, algorithms, etc), but it also leaves room to be more creative than just writing code such as animation, 3d modeling, and shaders. I have a fascination with math and design and love combining them to make visually appealing results.

Through my interest in game development, I developed an interest in general problem solving through programming, and began working professionally as a programmer at 21 years.

In my spare time I run a gaming community online, acting as sort of a community manager. I also moderate several other online communities. I used to regularly do livestreams for a few years and am now a part of several streaming communities where I do collaborations from time to time.

I have also run and managed several public gaming servers. Most notably I managed a very large Minecraft server with hundreds of users with custom mods that I wrote myself.

I've always had some small project I've been working on experimenting with new techniques, algorithms and technologies.

I'm mostly self taught and have learned a lot from mentors I've had.

## Technologies

I am proficient in C#, Python/GDScript, Rust, Lua, JavaScript, HTML and CSS. I have done some production work in C++ as well, and have dabbled in Nushell scripting as well. I have learned enough languages to pick up new ones pretty quickly.

I have experience with relational databases such as SQLite.

I have done web-related development, including frontend (plain JavaScript and jQuery) as well as backend (using low-level frameworks like uWSGI to high-level frameworks like Rocket).

I have some experience with X509, as client certificates are used to access company resources at my workplace, and I've worked with HTTPS support in embedded platforms.

Most of my work supports multiple platforms, supporting all the major desktop platforms (Windows, Linux and macOS) and targeting Android for certain mobile projects.

I enjoy tracking down bugs, and understanding where bugs originate from.

I have multi-year experience with editor-based game engines like Unity, Unreal Engine, Godot and Pico8, and have some experience with GameMaker. In addition I've worked with the Rust-based engine Bevy.

I have also written my own game engine, a lightweight 2D engine. It was designed to run XNA games on iPhone/iPad using GLSL.

I enjoy making things look good (in the web world, figuring out how to use CSS to make pages and their widgets to behave nicely, and in game development using shaders to give objects/worlds a polished look).

I have an interest in VR and related technologies as well.

I have worked with profilers and have, mainly through my interest in game development, plenty of experience with optimization, and how to reason around code performance.

I've primarily been working with Git and fossil for source management, but have some experience with Subversion as well.

I like exploring how to use LLM's to increase my productivity, and have built several applications, some pretty complex, with the support of LLM's.

My preferred platform is Windows, but I have plenty of experience with macOS and have worked with Linux as well.

I also draw, sculpt, model and animate. I am comfortable with plenty of 3D softwares such as Blender, Maya, Sculptris, Crocotile and AC3D. I regularly draw using Photoshop, Sketchbook and Aseprite.

## Work Experience

- Extrude Interactive [Employee, 2011 - 2013]

-  **gamedev mobile**

- Worked on developing web/mobile applications for advertisements and promotions, maintaining several mobile apps and game development.

-  **service/backend**

- Developed an open source game engine designed to port XNA games to macOS/iPhone/iPad.

-  **gamedev mobile**

- Created a remake of Tigers Kycklingstuds called Chicken Dash using our open source game engine.

-  **gamedev**

- Created a game for Lindab called Air Duct Challenge, It was made to be shown at trade fairs to attract visitors and create engagement at their booth.

- qrnchTech [Employee, 2017-2025]

-  **service/backend**

- Worked on a uwsgi-based web server platform. Implemented routing, session management and basic authentication.

-  **service/frontend service/backend**

- Worked on a Rocket-based web server platform. Implemented unified frontend/backend forms management, including server-side form validation and frontend field error reporting.

-  **service/frontend service/backend**

- Worked on a customer download portal with subscription management. Did both front-end (HTML, CSS and JavaScript) as well as back-end implementation. Modelled database and implemented SQLite queries in backend.

-  **service/frontend service/backend**

- Worked on a monitoring and management interface for an embedded platform for multiple products; a fiberswitch, a rack solution and a synchronous protocol converter.

-  **gamedev**

- Designed, implemented and deployed a VR game in Unreal Engine.

▸ 

Developed several in-house prototypes:

- A pod-racing game, intended for VR. (Highly motion sickness-inducing)
- A 3rd person game that tweaks the light rendering of UE4 to create unique game mechanics based around a single light source.
- A recreation of the popular half-life mod TTT.

▸ 

Designed, implemented and deployed a multi-player platforming game in Unreal Engine. This game runs on desktop systems as well as on Android tables. It integrates against Steam and allows user content to be shared over Steam Workshop.

▸ 

Worked on a Linux-based middleware system for transferring data over data diodes. Ran tests, debugged issues in the core system and implemented cross-platform proxies/applications for it in Rust:

- Implemented an rsync-like tool for synchronizing directory trees over a data diode.
- Implemented an SMTP proxy for sending emails over data diodes.
- Implemented an UDP proxy for sending UDP packets over data diodes.

▸ 

Implemented a multiplatform desktop GUI using the egui framework, for administrating data diode middleware.

• link22 [Consultant, 2018]

▸ 

Developed a Qt-based desktop interface for a secure transmission application.

## Open Source Work

- Working on *Patchwork*, which started as a Markov toolkit library written in Rust, but has grown to be far more versatile than just supporting Markov operations. Include its own language parser. • Implemented idiomatic iterators for the Rust crate *qlrumap*.

## Personal Projects

- Rogue Raiders, an upcoming online multiplayer party platformer made in Godot. Currently in development.
- I've built many game prototypes, to varying degrees of completeness:
  - GameMaker:
    - Glass Trubbel, a pacman/snake like game where you control a ghost that eats ice-cream and tries to avoid getting caught. This was the first game I ever made.
    - Paintball Arena, a first person 3D shooter made to replicate professional paintball tournaments, also included an editor where you could place out obstacles and make symmetrical paintball fields. This was my 3rd year Gymnasium project that I got the highest grade possible for.
  - XNA:
    - Many projects, now lost in time.
  - Unity3D:
    - Toybox, a nearly finished physics sandbox game with a level editor.

- Becalmed, a 3rd person pirate game with procedurally generated islands, town building, treasure maps and sailing.
  - Pictionary, a lightweight VR drawing application where people draw in VR and spectators can guess on the drawing.
  - Star Jumper, an infinite runner that got so far it was Steam Greenlit.
  - SOAF, a realistic first person shooter with parkour elements using a combination of voxels and prefabs to let players create large levels with fine details.
- UnrealEngine
  - BallGolf, a multiplayer 3D golf game inspired by Kirby Golf.
- Godot
  - Little Adventure Game, a 2D retro soulslike demo that later got rewritten into the multiplayer platformer Rogue Raiders.
- *Cordia* is a Discord bot, written in Rust, that is used in my gaming community. The bot can act as a community member using an LLM and has some randomized personality traits, and also supports streaming music.
- *Patchwork Studio* is a egui-based GUI for *Patchwork*, which includes an editor with a custom syntax highlighter for the Patchwork language.
- *MomoBot* is a Discord bot, written in Rust and hosted on Render, that has Infinity Nikki and Twitch related integrations, and is used actively in the HappyHeartie Streaming Community.
- *NybbleOverlay* is a stream overlay made in Godot with Twitch integrations.
